No. is the number of results predicted by chance to have score greater than or equal to the score of the result being part and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dr. WPI; 97-042299/04.

Dr. Detection of polymorphic genetic markers of the form pr | Octobarre | Octo
DR WPI; 97-042299/04.

DR Dr betection of polymorphic genetic markers of the form protection of polymorphic genetic markers of the form produced form of polymorphic genetic acid mols. as primers produced form of polymorphic repeat sequences (dC-dA)n. (dG-dT)n which can be used as genetic contains the sequence (dC-dA)n. (dG-dT)n which can be used to detect these crown arkers. Primers based on these sequences can be used to detect these crown arkers. Primers based on these sequences can be used to detect these crown arkers. Primers based on these sequences can be used to detect these crown arkers. Primers based on these sequences can be used to detect these containing the repeat such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) crobe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat contains the repeat sequence is from the marker clone Mdf7 which contains the repeat contains the formula: (CA)20TA(CA)2.

Sequence 46 BP; 23 A; 22 C; 0 G; 1 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                             PT Polymorphic bowlne DNA markers - used in genetic identification,
PT gene mapping, and selective breeding
PS Table 7; Page 379; 517pp; English.

CC The sequence is that of a bowlne microsatellite sequence obtd.
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bowlne genome is estimated at >100,
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellites sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC opTIPRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economic trait
CC see also Q33501-34437.

Table 7; Page 277; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC Screening a library of bovine MboI DNA fragments of between
CC one out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (76)n >9 microsatellites in the bovine genome is estimated at >100,
CC (00. The sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC amplification of the corresp. microsatellite (using the program
CC OFTIPRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC icol, or genes involved the determinism of economically important
CC can genes in cattle, to allow selective breeding.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       per detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols as primers bisclosure; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences to the isolation of polymorphic repeat sequences can having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis of containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf36 which contains the repeat sequence analysing the formula: (AC)15AT(AC)6A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding gene mapping, and selective breeding Table 7; Page 352; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (T)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                           Microsatellite sequence from clone TGLA438.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences containing the sequence (dc-dA)n. (dc-dT)n which can be used as genetic containing the sequence on these sequences can be used to detect these commercial sepecially for use in e.g paternity or maternity testing, commercial animal or plant breeding or pedigree analysis. Commercial animal or plant breeding or pedigree analysis.

CC onmercial animal or plant breeding or pedigree analysis.

CC interruptions and without adjacent repeats of another sequence; cc interruptions and without adjacent repeats of another sequence; cc interruptions and without adjacent repeats of another sequence; cc interruptions and without adjacent repeats of another sequence; cc interruptions and without adjacent repeats of another sequence; cc interruptions and without adjacent repeats of another sequence; cc interrupted by no more than 3 consecutive non-repeat bases; cc in ompore than 3 consecutive non-repeat bases from a run of at least compound perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted.

CC This sequence with structure: A(A) 15TAGG(A)6, would be scored as 2 creates separate coeffect repeats seemences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding Table 7; Page 353; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).
                                                                                                                                                                                                                                                                                                                                                                                                                         Q34056;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as Disclosure; Column 349-350; 186pp; English.

Table 7; Page 304; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine MboI DNA fragments of between

cone out of 50 clones cross-hybridised. Assuming independent

distribution of microsatellites and MboI sites, the frequency of

(T6)n >9 microsatellites in the bovine genome is estimated at >100,

000. The sequence information for ca. 230 such bovine microsatellites

is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence

were used to generate the required PCR primers for in vitro

applification of the corresp. microsatellite (using the program

copyIPRIM). The microsatellites may be used to identify individuals,

for parentage testing, and in the genetic mapping of economic trait

loci, or genes involved the determinism of economically important

contraits each in cartile. To allow selective breeding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19028 AGTGCTGGGATTACAGGCATGAGCCACTGCGCCC 19061
                       polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding Table 7; Page 271; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MDOI DNA fragments of between 250 and 500 bp with an (AC)15 and a C)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MDOI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genetic mapping;

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC Screening a library of bovine MboI DNA fragments of between
CC Cone out of 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC Cone out of 50 clones cross-hybridised. Assuming independent
CC (T6)n >9 microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC out of the sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC opTIPRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economically important

/note="Vector: pcDNAII (Invitrogen); Site_1: BstXI;
Site_2: NotI; The library was constructed by G.
Lanfranchi. This library is not subtracted nor normalized.
The first strand cDNA was primed with a biotinylated oligo-dT-NotI primer
(5'-biotin-AACCCGGCTGGAGCGGCCGCTTTTTTTTTTTTTTTTT-3'). The ds cDNA was sonicated and size-selected in the range 350-550 bp. The 3' specific fragments were selected by streptavidin coated magnetic beads, ligated to non-palindromic BstXI adapters, NotI digested and directionally cloned into BstXI-NotI cut pcDNAII vector."
